🛍️ LUXEHAVEN: FEATURE #3 BUILD DOCUMENT

User Authentication + Accounts + Wishlist

Field	Detail
PRD ID	PRD-003
Feature Name	User Authentication + Accounts + Wishlist
Builds On	PRD-001 (Foundation) & PRD-002 (Catalogue) +1
Priority	P0 — MUST HAVE +1
Sprint	Sprint 3 — Week 3 +1
Target Markets	United States (USD) + United Kingdom (GBP)

Export to Sheets

PART A — PRODUCT REQUIREMENTS DOCUMENT (PRD-003)

1. Business Objective

To convert anonymous browsers into known customers. This feature provides the secure infrastructure needed for a trusted US/UK shopping experience, enabling personalized features like wishlists and order tracking before moving to the revenue-generating Checkout phase.

+2

2. User Stories

- **US-001:** As a customer, I want to sign in with Google or Apple so I don't have to remember another password.

+2

- **US-002:** As a UK customer, I want my account to show my address in UK format (Postcode/County) so I can trust the delivery process.

+2

- **US-003:** As a customer, I want to "heart" products to my wishlist so I can buy them later.

+1

- **US-004:** As an admin, I want to see a list of registered customers in the dashboard.

3. Functional Requirements

- **NextAuth.js v5:** Full implementation of Social Auth (Google/Apple) and Credentials (Email/Password).

+1

- **Wishlist Sync:** Items added while logged out (Local Storage) must auto-merge to the database profile upon login.
- **Protected Routes:** The /account and /wishlist routes must redirect unauthenticated users to /login.
- **Account Dashboard:** Profile management and Address Book (US/UK localized).

+1

PART B — BOLT.NEW BUILD PROMPT (WITH TESTING STEPS)

Instructions for User: Copy the box below into Bolt.new. I have added your specific request for full scenario testing.

Markdown

BOLT.NEW PROMPT — FEATURE #3: AUTHENTICATION, ACCOUNTS & WISHLIST

Build Feature #3 for 'LuxeHaven'. You must use NextAuth.js v5 and integrate with the existing Prisma schema from Features #1 and #2.

=== WHAT TO BUILD ===

1. SCHEMA: Add User, Account, Session, Wishlist, and Address models to schema.prisma. Use tenantId on every model.

2. BACKEND: Create NestJS modules for Auth, Wishlist, and Users.

3. FRONTEND:

- /login & /register pages (premium shadcn/ui design).
- /wishlist page showing ProductCards for saved items.
- /account dashboard with Profile and Address management.

4. UI UPDATES: Update the Header to show User Avatar and Wishlist count badge.

=== STRICT TESTING & VERIFICATION STEPS ===

Before delivering the code, you must simulate and verify the following scenarios to ensure zero issues:

- SCENARIO 1: Verify a user can register, log in, and log out successfully using JWT sessions.
- SCENARIO 2: Test the Wishlist 'Heart' icon. Ensure it saves to LocalStorage when logged out and syncs to the Database upon login.
- SCENARIO 3: Test Address Validation. Ensure UK users can enter Postcodes and US users can select States.
- SCENARIO 4: Verify that unauthenticated users are blocked from /account and redirected to /login.
- SCENARIO 5: Check mobile responsiveness for the login forms and account dashboard.

Ensure all TypeScript types are strict and error-free. Do not deliver the code until these scenarios are internally validated.

PART C — KNOWLEDGE BASE UPDATE

Add this to your Bolt.new Settings → Knowledge Base before running the prompt to ensure the AI follows the new security rules:

AUTH & USER SECURITY RULES * Use **NextAuth v5** (Auth.js) for all session management. * Every user-specific query MUST filter by tenantId. * Store addresses with a country field (US or GB) to trigger correct UI layouts. * Comply with **GDPR (UK)** and **CCPA (US)** by providing "Delete Account" and "Export Data" buttons in the account settings.

+1

Summary & Next Steps

1. **Update Settings:** Add the **Part C** rules to your Bolt Knowledge Base.
2. **Paste Prompt:** Run the **Part B** prompt in Bolt.new.
3. **Review:** Once Bolt finishes, check the /account page. Since you are in NZ, use a VPN or manually toggle the currency/locale to **UK** to verify the address fields change to "Postcode" and "County".
